

Practical Exam Scripts

This folder contains the solutions for Part 2 of the exam: one comprehensive script per task, each broken into functions for its sub-items. Both scripts are executable (`chmod +x`).

Structure

```
Practical/
├─ task1_comprehensive_script.sh      # Task 1, items 1-4
└─ task2_system_administration.sh    # Task 2, items 1-6
```

Usage

Run the whole task (all functions in order):

```
sudo ./task1_comprehensive_script.sh
sudo ./task2_system_administration.sh
```

Or run just one function/sub-item:

```
sudo ./task1_comprehensive_script.sh install_web_app
sudo ./task2_system_administration.sh user_management
```

Available functions:

- `task1_comprehensive_script.sh`: `install_web_app`, `install_dns_server`, `backup_script`, `health_check_script`
- `task2_system_administration.sh`: `user_management`, `disk_filesystem_management`, `advanced_user_management`, `security_permissions`, `advanced_networking`, `process_job_control`

Before running

A few functions reference machine-specific values that must be edited at the top of the relevant script before running:

- `disk_filesystem_management` (Task 2) — set `DISK_PARTITION` to the real partition you

want to format (this is a destructive operation).

- `advanced_networking` (Task 2) — set `NET_IF`, `STATIC_IP`, and `GATEWAY` to match your actual network interface and addressing.

Notes

- `backup_script` and `health_check_script` (Task 1) are designed to be scheduled with `cron` (suggested schedules are commented in the script).
- `user_management` (Task 2) creates and deletes a demo user (`demoUser`) purely to demonstrate `useradd` / `usermod` / `userdel`.
